

Amity e-Commerce Solutions: Card Flex

Card Flex is an enterprise application that allows an organisation to collaborate on card expense approvals across distance and in a time-convenient manner. With Java J2EE APIs, the system can interface with any external system capable of working with Java technologies.

It comes with the following features:

- Uploadable help scripts for cost allocation
- Import service of CDF 2.00 (Common Data Format) files for bank statements as used by WestPac and MasterCard
- Import service for approval structures
- Accurate cost splitting
- Card, personnel and company administration services
- Approval management system with e-mail, SMS or fax notification
- Full J2EE compliance with scalable, load appropriate architecture
- Expense allocation data providing for accurate reversals and reposting of costs into the general ledger

Collaboration process

1. Import expenses from bank statements supplied by bank in electronic data format
2. Distribute expense statements for review by card holders, allowing them to assign costs to financial cost centres, using company rules in the form of help scripts to guide assignment
3. Distribute cost allocations for approval through the relevant approval chains
4. Release assigned costs for the financial system to correctly update the general ledger
